

Have you had a cybersecurity risk assessment?

- How well would you score on a cybersecurity insurance audit?
- Who watches your network and computers while you sleep?
- What's lurking on your computers that you don't know about?
- Are you protected against ransomware and cybersecurity attacks?
- Is your IT provider a key partner in driving your business or just a fix it service?

Cybersecurity protection is more than just antivirus or a technology product toolset. Break/fix IT doesn't protect you or help your business succeed and grow. When was the last time your IT provider reviewed your security, trained your staff, or improved business operations?

Today's cybersecurity threats are constant and evasive while computer technology is increasing in complexity, requiring more time and labor to properly manage and maintain. Our NetMedic system simplifies network infrastructure management, monitoring, and protection, allowing you to focus on business and not maintenance. Now you can work remotely without worry.

ONE2ONE NetMedic Deflector is a multilayered protection and management solution to reduce your security risk while utilizing

technology to drive your business operations across single or multiple locations. NetMedic, delivered as a managed service, mitigates problems and is an invaluable asset to ease the burden on business

administrators while providing a detailed view of your infrastructure with unlimited remote labor.

If your IT provider is just a repair service they are holding you back and placing your business at risk. Combine IT security policies and user training to mitigate cyber risk, improve security posture, and identify problems before they escalate out of control.

Contact **ONE2ONE** today to protect and energize IT to drive business growth and operations!

Features & Benefits

- 24x7 Security Operations Center
- Reduce business and security risk
- Outsourced
- Monitoring & Alerting of Devices
